IEEE Congress on Evolutionary Computation, 25-28 May 2015

### Introduction

Motivation •0000

> Service-Oriented Architecture (SOA): Organise processes and data in reusable modules for integration into new applications.

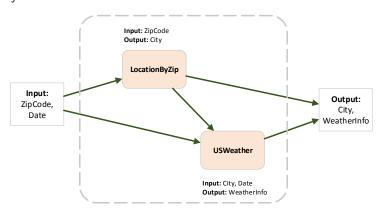

#### Web service

A functionality module that provides operations accessible over the network via a standard communication protocol.

# Web Service Composition

The combination of Web services to achieve a more complex task. Fully automated scenario:

New weather by zip code service

# Composition Dimensions

- **I Functional correctness:** Service inputs and outputs must be properly linked (e.g. Four Digit Number  $\rightarrow ZipCode$ , but not FourDigitNumber  $\rightarrow$  City).
- **2 Conditional constraints:** Condition leading to multiple possible execution paths (e.g. if *City* is a *NewZealandCity*, produce WindForecast instead of GeneralForecast).
- 3 Quality of Service (QoS): The overall quality of the composition (e.g. lowest execution time, lowest cost).

# **Existing Approaches**

#### **AI Planning**

Build a solution service by service.

Dimensions: Functional correctness, conditional constraints.

### **Evolutionary Computation (EC)**

Improve population of solutions over multiple generations.

Dimensions: Functional correctness, QoS.

### **Hybrid Approaches**

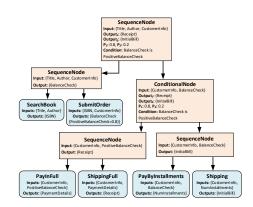

Combine AI planning and EC ideas.

Dimensions: Functional correctness, QoS.

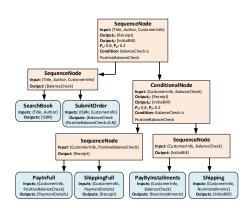

#### Goal

To propose a Genetic Programming (GP) composition approach that simultaneously considers all dimensions.

- Trees preserve functional correctness
- Conditions encoded in trees
- 3 Optimisation performed on QoS

# Candidate Representation

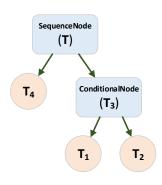

## Population Initialisation

An algorithm is used to create a candidate in graph format, and then translate it into a tree representation.

```
Input : I, O1, O2, C, P
    Output: candidate tree T

    if O<sub>2</sub> ≠ ∅ then

         G_1 \leftarrow \text{createGraph}(I \cup C.if, O_1);
         G_2 \leftarrow \text{createGraph}(I \cup C.else, O_2):
         T_1 \leftarrow \text{toTree}(G_1.input):
          T_2 \leftarrow \text{toTree}(G_2.input);
          T_3 \leftarrow \text{new ConditionalNode}(C);
          T_3.leftChild \leftarrow T_1:
          T_3.rightChild \leftarrow T_2:
 9:
          if C \square / then
10:
              T_3.prob \leftarrow P;
              return T3:
11:
12-
         else
              G<sub>4</sub> ← createGraph(I, C,else):
13:
              T_4 \leftarrow \text{toTree}(G_4.input);
14:
              T_3.prob \leftarrow T_4.final.P;
15:
16:
               T \leftarrow \text{new SequenceNode()};
               T.leftChild \leftarrow T_4:
17:
              T.rightChild \leftarrow T_3:
18:
              return T:
20:
         end
21: else
         G \leftarrow \text{createGraph}(I, O_1);
22:
          T \leftarrow toTree(G.input):
24
         return T;
25: end
```

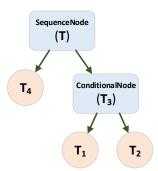

### Mutation and Crossover

**Mutation:** Selects random node and replaces it with equivalent subtree.

**Crossover:** Swaps any two equivalent terminal nodes.

## **Fitness Function**

Experiments

### Verbatim

### Example (Theorem Slide Code)

```
\begin{frame}
\frametitle{Theorem}
\begin{theorem}[Mass--energy equivalence]
$E = mc^2$
\end{theorem}
\end{frame}
```
